

## WEBs N4.11 Breaking Change – BWeeklySchedule #getSummary override

### Breaking Change

As described in NCCB-52397, BWeeklySchedule#getSummary cannot be localized, so weekday names always appear in English on the scheduler's Summary tab.

### Summary

In order to resolve this, getSummary(BAbstractSchedule) needs to take a Context. Since BWeeklySchedule is public API, a developer could have overridden getSummary(BAbstractSchedule) to do something else. Since the framework now calls getSummary(BAbstractSchedule, Context), that override will no longer be used by the framework until the developer updates its method signature to also take a Context.

### Details

Starting in 4.11, any override to BWeeklySchedule#getSummary(BAbstractSchedule) must add a second Context argument. Otherwise, their override will not take effect, and whatever special text you wanted to show in the Summary tab will be replaced with the regular text previously provided by the framework.
