Pilot HON 625

PRODUCT INFORMATION

Serving the Gas Industry Worldwide
Pilot HON 625

Application, characteristics

Application

- Pilot for the gas pressure regulator HON 402
- Pilot for outlet pressure control
- Suitable for non-aggressive gases, other gases on enquiry

Characteristics

- External, two-stage pilot
- Compact design
- Integrated load limiting stage with loading pressure gauge
- Integrated fine mesh filter
- Easy installation, maintenance and accessibility thanks to external arrangement of the pilot
- Easy setpoint spring replacement
- Very easy to maintain, few wear parts
- Adaptability to various operating conditions and existing network structure thanks to adjustable throttle
- High regulating accuracy due to upstream load limiting stage
- Large setting range
- Low closing pressure

**Class of closing pressure zone SZ**

SZ 2.5

**Material**

- Body parts: Aluminium alloy
- Diaphragms, sealing rings: NBR
- Internal parts: Steel, Al alloy

**Ambient and operating temperature range (DIN EN 334)**

Class 2: –20° C to +60° C

**Strength – leak tightness – functionality**

In accordance with DIN EN 334

**CE mark in accordance with PED**

![CE mark](image)

**Type approval test according to**

- PED (DGRL)
- GAD (GGRL) as a component for gas consumption devices

In combination with the gas pressure regulating device HON 402 pending. According to DIN EN 334, the pilot is a component of this device.

**Explosion protection**

All mechanical components of this device are without potential ignition sources and / or hot faces. They are not subject to ATEX 95 (94/9/EC). All electronic accessories, on the other hand, meet ATEX requirements.
The pilot HON 625, together with the main valve (e.g. HON 402), has the task of keeping the outlet pressure at a constant level within predefined limits – regardless of changes in gas consumption and changes in the inlet pressure.

Depending on the setting range, the pilot HON 625 is provided in a High Pressure (HP) or Low Pressure (LP) design. In this connection, only the measuring units of the pilot control stages differ in their sizes/dimensions; the (general) layout, however, is the same. The pilot is comprised of a pilot control stage, the load limiting stage and a fine mesh filter unit for protection against dirt from the input pressure. All components are integrated in the compact pilot.
The outlet pressure to be regulated is guided over the measuring line to the pilot control stage and compared with the setpoint value specified as a force acting on the setpoint spring. Every regulation deviation is followed by a corresponding change of the distance between the nozzle and baffle plate and thus a proportional change of the load limiting pressure as well as the downstream loading pressure. With the throttling diaphragm, the valve opening of the main valve is changed relative to the comparison of the outlet pressure to the setpoint. The load limiting stage provides a constant load limiting pressure for the amplification of the regulating pulse. It compensates for significant inlet pressure fluctuations in comparison to the pilot control stage. With the adjustable load limiting pressure and the adjustable throttle, the pilot can be adapted to the conditions of the regulating line.

The construction and mode of operation of the load limiting stage correspond to the pilot control stage.

At zero drop the amplifying valves of the pilot control stage and load limiting stage remain closed. The loading pressure corresponds to the inlet pressure, and the main valve, e.g. HON 402, remains closed (closing pressure). For the opening process, the loading pressure is increased by the amplifying valves of the load limiting stage and pilot control stage and flows into the outlet pressure chamber.

Application example: HON 402 with outlet expansion and HON 625
