## MICRO SWITCH Technology

## APPLICATIONS

Presence
Detection
Ensures door latching and safe operation

Float Switch
On/off power to stop overflow conditions

Flow Switch
Enables safe and efficient water usage

Power Switch
Reliable system control for motors, pumps, fans

Operator Controls
Interface control for system auxiliary functions

## VALUE PROPOSITION

The V19, Honeywell's unsealed MICRO SWITCH family provides a cost-conscious switch solution to assist in hitting overall system-level cost and design goals in high volume applications. The V19 switch provides a fully certified, reliable, and repeatable solution over the lifetime of the product. RAST 2.5, 5, and 7 termination styles available for automated manufacturing requirements (white goods).

| V19 FEATURES | V19 BENEFITS | OUR VALUE |
| :---: | :---: | :---: |
| 5 A \& 16 A | Electrical ratings for design flexibility in one industry standard package size | Competitive cross references available |
| > 1M mechanical operations | Globally certified for reliable, repeatable actuation for life | Snap-spring mechanism with more than 80 years of MICRO SWITCH service |
| UL/CSA, cUL, CE, UKCA, ENEC, CQC | Identical system designs for platform applications worldwide | Certifications enable global design acceptance and cost savings in agency approvals |
| Cadmium-free contacts | RoHS 3, REACH and CalProp 65 compliant |  |
| RAST 2.5 termination and housing | Enables IDT termination for automated machinery builds on signal-level and control circuits | Combined terminal and housing construction enables agency certification (UL94V-O \& IEC 60335-1) and material cost savings |

## MICRO SWITCH

 V19 SERIESUnless otherwise stated, all characteristic measurements tested according to UL, EN, and IEC standards and conditions. Parameters and acceptance criteria validated and confirmed in a certified lab environment. Technical details available upon request.

FIGURE 2. LOAD LIFE CURVES

The data used to develop the following load-life curves was obtained through actual laboratory testing under controlled ambient conditions. It does not attempt to include or address specific application variables, and is meant as a representative guide to potential performance expectations of Honeywell V19 Series switches.

The following graphs, showcasing general reliability expectations, was developed from lab tested electrical lifetime data. Subsequent reliability calculations were based on:

- Life curve regression analysis was used for mean life cycles to achieve a smooth life curve
- To determine the mean life cycles for all currents, the Weibull distribution method was used
- From the regression analysis, the best fit life curves were determined based on data rankings

Tests representing the V19S05 design (5 A variant) were conducted at three
(3) intermittent current levels: 2 A ,
3.5 A and 5 A. Similarly, tests representing the V19T16 design (16 A variant) were executed at four (4) intermittent current levels: $3 \mathrm{~A}, 7 \mathrm{~A}, 12 \mathrm{~A}$ and 16 A . All switches used to obtain data for these calculations were tested until failure occurred. For the purposes of this evaluation, failure was defined as ten (10) cumulative faults to change electrical state.

MTTF = Mean Time To failure
$\mathrm{B} 10=$ The number of cycles at which 10 \% of the V19 switches will reach failure
